Buzzfeed recruitment team,

I am applying to be considered for the front-end engineering position at BuzzFeed. I am the perfect candidate for pushing an efficient, sophisticated front-end code. My experience building web applications,

While my work experience is in design, my passion and focus has been web development. Before going to Flatiron School, I took classes in computer science as well as self-myself algorithms and web graphics. At Flatiron, I learned to work across the stack, writing clean, optimized code in SQL, Ruby, Rails, JavaScript (including many libraries) and HTML5/CSS/SASS. I am as excited about generating a relational database as developing a sophisticated and user-friendly front-end.

In my projects, I have had to learn and implement the following (links to the apps and their source code are on my CV):

- data visualizations using Highcharts on a project that visualized Amazon product reviews
- ajax requests with JQuery on all projects
- MVC architecture using rails on all projects
- asynchronous loading, delegating computation to web workers, creating prototypes on the Martha Friedman sculpture visualization app
- version control with Git, repositories hosted on Github
- deployment to heroku and Amazon EC2

Lastly, I love communicating with clients and coworkers. Presenting and making people laugh come naturally to me. Outside of web development, I'm an artist and avid reader. My visual art projects encompass 3D web graphics. Currently, I'm working on a sculpture gallery for a Brooklyn-based artist. My 3D work can be viewed at workandtext.com, my portfolio website.

Sincerely,

Gerardo Veltri
